Computational Modeling

moss / water reservoir

In addition to other plants, moss is the main water reservoir. It is able to absorb and store large quantities of water after heavy rainfall events. This not only reduces the risk of flooding, but also allows the water that is so important in dry periods to be stored on site.

3D printing / connections

Individual strands of the structure can be printed and delivered separately. When joined together on site using a connector system. To simplify transport to areas that are difficult to reach, modules can also be prepared and then installed.

openings in the structure

Small animals and insects such as beetles can use the openings and gaps between the printed fibers as a new habitat. Plants can also grow inside Terra Spongia after soil and dirt have accumulated there.

cavities / openings

Small and large cavities provide a habitat for various animals and insects. For example, marmots, glacier fleas, stoneflies and salamanders can be found here. The small chambers in the structure are a perfect shelter and can be used as nests.

Material Study

Study 1:

Materials used:

- Wood Cuttings 80 ml
- Dirt 60 ml
- Aga Aga
- Leaves
- Bark

Stability Rating: 3/10

Crumbles easily/ too fragile

Study 2:

Materials used:

- Wood Cuttings 80 ml
- Dirt
- Aga Aga
- Leaves
- Bark
- Water

Stability Rating: 1/10

Doesn't properly dry

Study 3:

Materials used:

- Wood Cuttings 80 ml
- Dirt
- Aga Aga
- Leaves
- Bark
- Water

Stability Rating: 5/10

Flaky/ too fragile

☆ Study 4:

Materials used:

- Wood Cuttings 80 ml
- Dirt
- Aga Aga
- Leaves
- Sand
- Water
- Coffee grounds

Stability Rating: 9/10

Study 5:

Materials used:

- Wood Cuttings 80 ml
- Dirt
- Aga Aga
- Leaves
- Sand
- Water
- Coffee grounds

Stability Rating: 6/10
